ONE SUBJECT, EVERY CHANNEL: CONSENT IS PER TLD, DATA MOVES IN REAL TIME

every enterprise runs a CMP per country site, four clouds behind a JVM bus, and two audiences that need the same answer

SHARED SUBSTRATE · CLOUDFLARE OneTrust's CDN and geolocation, Shopify storefronts and Webflow hosting all answer through Cloudflare — cf-ray on every response.
Each vendor owns its own zone. The brand's namespace is the one place on that shared network the brand controls, so the fix sits where the traffic already is.

A · TODAY: CONSENT LIVES IN EACH SITE'S BROWSER

uk.brand.com
UK GDPR · PECR
OptanonConsent cookie
own CMP script, own domain ID

ca.brand.com
PIPEDA · Québec Law 25
OptanonConsent cookie
own CMP script, own domain ID

fr.brand.com
GDPR · CNIL guidance
OptanonConsent cookie
own CMP script, own domain ID

1 · Cookie scope across markets
Scoped to .brand.com, a UK choice is replayed on fr.brand.com under the wrong rules. Per host, a withdrawal never travels.

2 · Dangling subdomain: promo.brand.com
Any subdomain may set a .brand.com cookie, so one forgotten CNAME can forge "accept all" for every market.

3 · Plugin wildcards in the visible theme
Domain=.brand.com · Access-Control-Allow-Origin: * · postMessage(msg, "*") · script-src * — a map anyone can read.

4 · A session ID, not a subject
The record is keyed to a browser ID in the vendor's log. POS, app, chatbot and devices never present it.

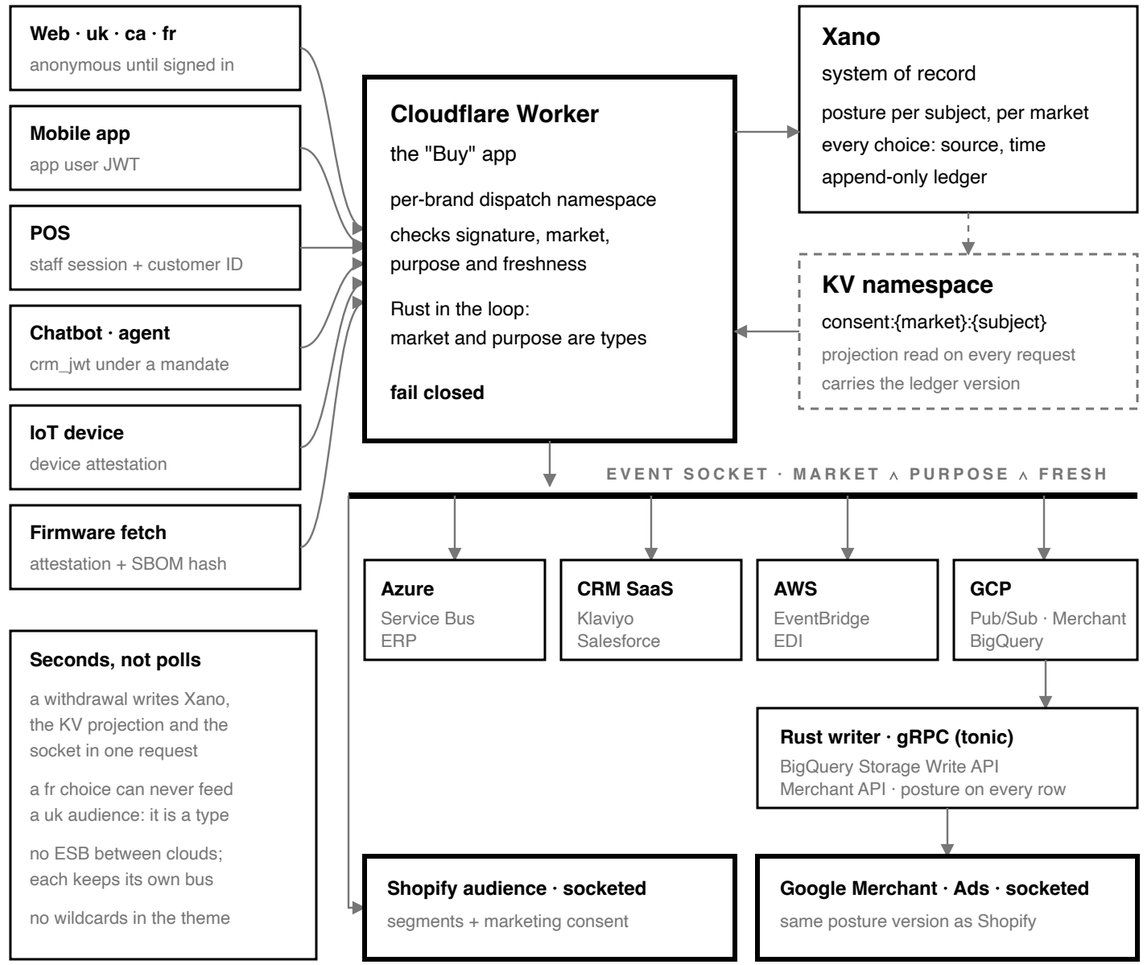

JVM service bus, polled every 15 min
Azure — ERP: SAP, Dynamics
SaaS — CRM: Klaviyo, Salesforce
AWS — EDI: X12, EDIFACT
GCP — Merchant Center, BigQuery

→ **Google Merchant · Ads audience**
built from the last export and the last poll

→ **Shopify audience**
segments on a separate marketing-consent field

A withdrawal on fr.brand.com reaches both audiences only after the next poll and the next refresh — and never reaches the till, the app or the device.

B · THE FIX: ONE SUBJECT, EVERY CHANNEL, SOCKETED

Heavy box = the gate or a socketed audience. Red dashed = a gap. Grey dashed = a projection, not truth.
Country sites are shown as subdomains. With brand.co.uk, brand.ca and brand.fr no cookie can be shared at all, which makes the subject record the only bridge.
