AUDIENCE TARGETS IN A CMS — DEFINITIONS, NOT MEMBERS

the CMS holds the query and the rules; Xano holds the people; the sync joins them and writes back totals only

Red dashed = a security gap.

LIFECYCLE — THE AGENT PROPOSES, A PERSON PUBLISHES

1 · Agent proposes
POST /v2/collections/{id}/items
isDraft: true; rationale, eval result

→ **2 · Person reviews**
checks the definition and rules;
the definition hash is recorded

→ **3 · Published, Live**
Status: Live; Retire by set;
no Collection template page

→ **4 · Sync reads Live only**
refuses a hash mismatch, or
Contains personal data: on

→ **5 · Destinations**
Customer Match with ad_user_data
and ad_personalization; Klaviyo

T3 The agent publishes its own audience

T4 Definition changed after approval

T2 A template page publishes the collection

WHERE EACH PIECE LIVES

Webflow CMS · Audience Targets (definitions)

DEFINITION
format: Shopify segment query
definition: the query, not members
definition hash · source system

TARGETING STATE
consent state · DSR rule
devices · device signal
location granularity and source · campaigns

AI
proposed by · rationale
eval result: PASS, FAIL, REVIEW
assistant summary · embedding text

APPROVAL AND LIMITS
approved by · approved at · ledger
min cohort · retire by
contains personal data: off

Also: Markets · Consent Purposes · Destinations · Adapters · DSR Types · Device Classes · Campaigns · Audience States

Live items →
← totals only

Sync (Worker)

reads Live items only
loads each matched person's state from Xano
checks DSR, consent, location, device, campaign, cohort
sends with consent fields

← state

Xano and the ledger · each person's state

```
{ "subject": "hmac:7e1a…",
  "consent": { "ad_user_data": true,
               "ad_personalization": true,
               "marketing": true, "training": false },
  "dsr": { "open": null },
  "device_class": "mobile_web",
  "location": { "country": "US", "region": "CA" },
  "campaigns": ["spring-sale"] }
```

and every per-person decision from each sync.
Never in Webflow.

T1 Members stored in the CMS

T7 Precise location or device IDs

T8 Secrets in the Destinations collection

SYNC ORDER FOR EACH MATCHED PERSON — THE FIRST FAILURE STOPS

1 · DSR
an open request excludes;
deletion and opt-out win
↓ excluded: open DSR

→ **2 · Consent**
every required purpose and
destination field granted
↓ excluded: consent not granted

→ **3 · Location**
market listed, not blocked;
its regime rules apply
↓ excluded: blocked market

→ **4 · Device**
class listed; allows personal-
ization if an adapter is set
↓ excluded: device not allowed

→ **5 · Campaign**
Live, in its dates, with its
consent requirements met
↓ excluded: campaign not live

→ **6 · Cohort**
below Min cohort: hold and
send nothing; else send
↓ state: held below cohort

T6 Open DSR still targeted

T5 Small slices identify people

AUDIENCE STATES — WHAT COMES BACK TO WEBFLOW (EXAMPLE: MIN COHORT 50)

SLICE	STATE	MATCHED	OPEN DSR	NO CONSENT	BLOCKED MARKET	DEVICE	SENT	COVERAGE
spring-sale · US · mobile_web	**Synced**	4,210	12	1,380	0	0	2,818	67%
spring-sale · KR · mobile_web	**Blocked by market**	910	empty	empty	910	empty	0	empty
spring-sale · UK · ctv	**Held below cohort**	empty	empty	empty	empty	empty	0	empty

Below Min cohort every count is left empty: small counts sliced by device, market and campaign can identify a person (C2).

EIGHT GAPS — AND THE FIX FOR EACH

T1 Members stored in the CMS
Fix: Definitions only; Contains personal data must be off, or the sync refuses the item

T2 A template page publishes the collection
Fix: Don't bind it to a Collection template page; every field on one is public

T3 The agent publishes its own audience
Fix: Agents create drafts only; a person reviews and publishes

T4 Definition changed after approval
Fix: A definition hash recorded at approval; a mismatch blocks the sync

T5 Small slices identify people
Fix: Counts below Min cohort left empty in every snapshot

T6 Open DSR still targeted
Fix: DSR checked first, before consent, on every sync

T7 Precise location or device IDs
Fix: Country or region and a device class only

T8 Secrets in the Destinations collection
Fix: Store the secret's name; the secret lives in Cloudflare or Xano

The CMS holds the query and the rules. Xano holds the people. Only totals come back.
